

TTE vs. system size, all solvers

$h=0.5$, $\alpha=1$ ($n_{\text{hidden}}=N$); $lr=0.08$, $\text{reg}=0.05$, $n_{\text{samples}}=200$, $\text{iter}=100$ matched across every series

Pegasus/Zephyr QPU: $N=16,32,64$ only (Zephyr's dense embedding doesn't fit $N \geq 96$ on this chip)

Time-to-epsilon vs. N
