

ITE / TTE vs. system size, all archived solvers, each at its own best-available operating point
 NOT hyperparameter-matched across solvers -- see script header for each series' (h, config, N range, n)
 (hollow markers at the same x are nudged apart vertically to stay distinguishable; the offset is cosmetic, not data)

(A) Iterations-to-epsilon vs. N

(B) Time-to-epsilon vs. N (D-Wave QPU omitted, no timing recorded)
